We built a reconciliation data platform — then used it to test how AI should review code

A real client needed reconciliation data made legible. We shipped a production platform for the **Indigenomics Institute** — and its own **30 merged pull requests** became the industrial dataset for a pre-registered study of multi-agent AI code review.

Research companion: "Evaluating Decorrelation in LLM Code Review: A Pre-Registered Study"

RESEARCH CONTRIBUTION

More AI reviewers don't help — decorrelation does. Agreement predicts truth only when the reviewers are independent.

89% 3 independent families agree → matches ground truth

54% one model, three runs → mostly noise

01 THE PROJECT — RAP DATA PORTAL

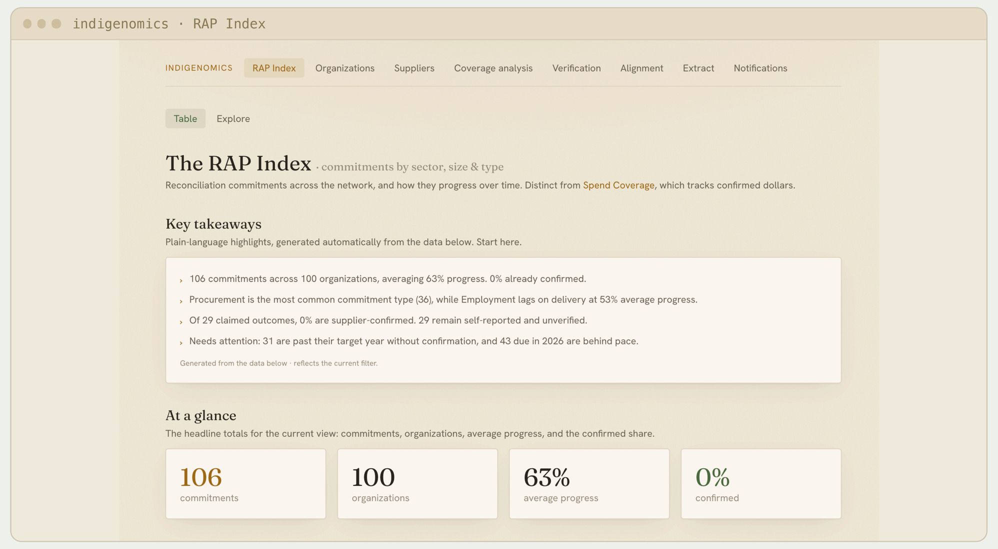
PROBLEM
Companies publish reconciliation commitments. Legal precedents sit scattered across court records. There is no searchable, verifiable, unified view — so nobody can track progress.

↓

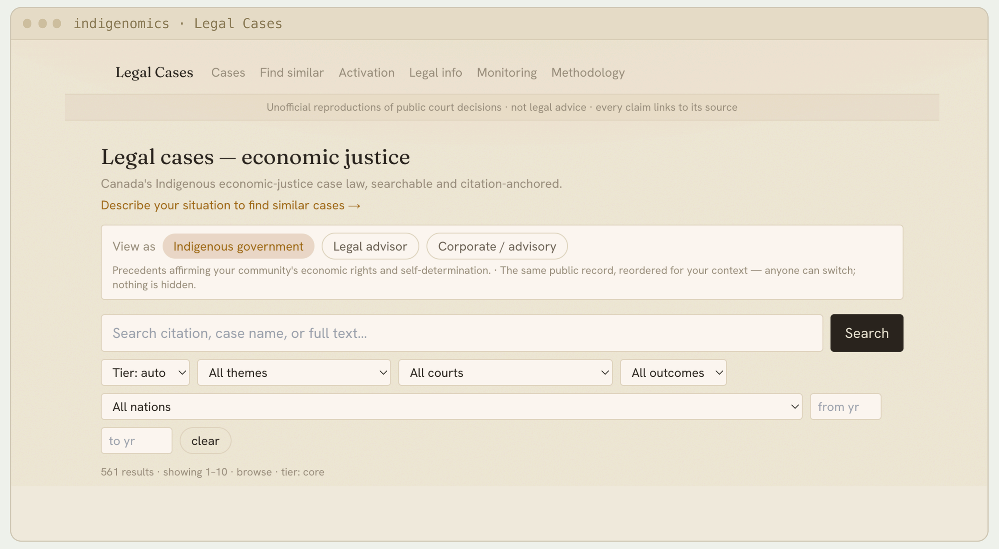
OUR SOLUTION
- Searchable RAP commitments
- Legal precedent database
- AI extraction from PDFs
- Human review workflow
- AWS serverless hosting
- Authentication & roles
- Progress tracking
- Coverage analytics

↓

WHO USES IT
- Indigenomics Institute
- Indigenous organizations
- Corporate partners
- Researchers & legal advisors



RAP Index
- 106 commitments · 100 organizations
- 63% average progress tracked



Legal Cases
- 561 economic-justice decisions
- citation-anchored, role-based views

02 HOW IT BECAME RESEARCH

Client problem
reconciliation data scattered & unverifiable

↓

We built the portal
production platform, shipped on AWS

↓

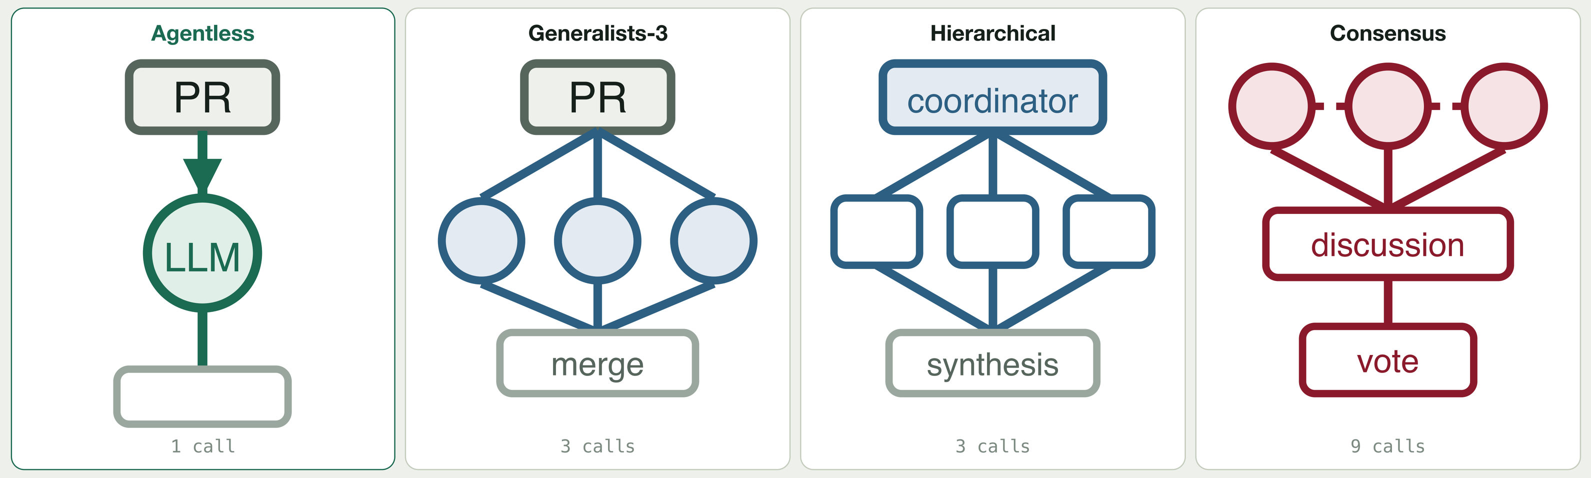
179 pull requests
30 of them ours — real, merged, AI-reviewed

↓

Benchmark dataset
E1 Qodo · E2 SWE-PRBench · E3 our portal — 2,415 reviews

↓

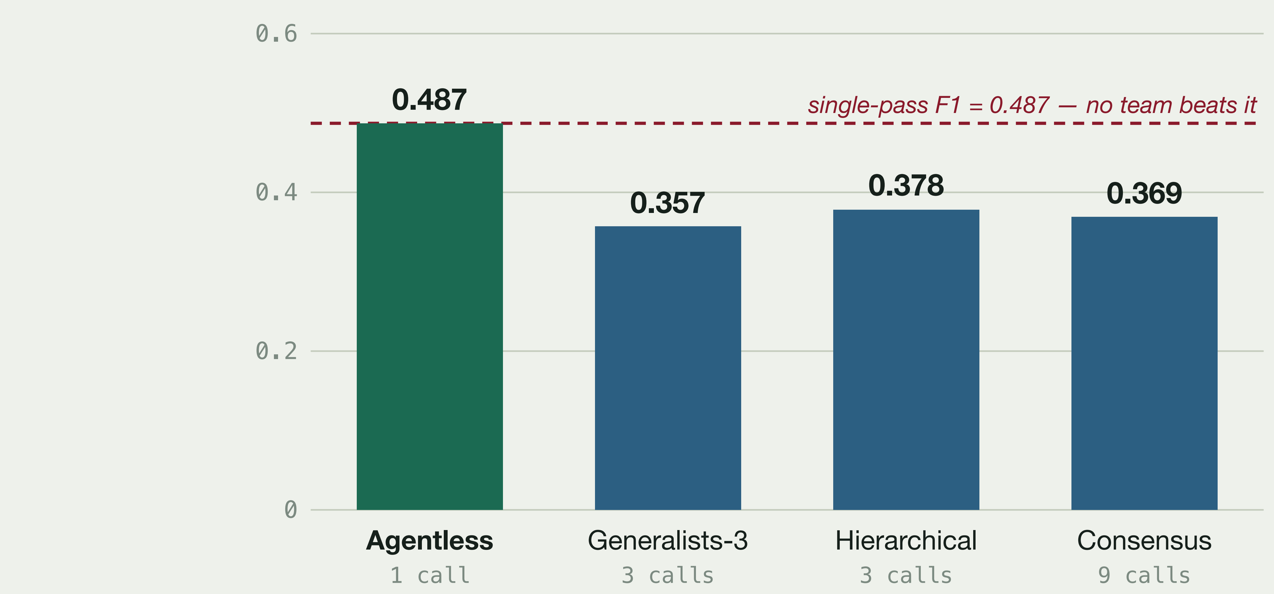
Four AI review architectures
each rung adds exactly one capability



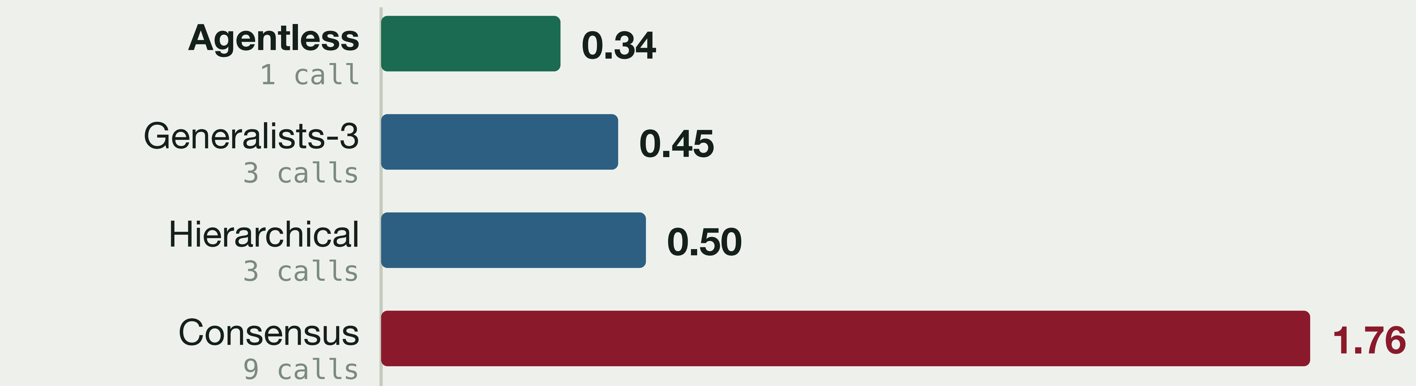
Held constant: same PR snapshot · same model (Claude Haiku 4.5) · same prompts · three runs per arm · pre-registered on OSF.

03 WHAT WE FOUND · E1 · QODO, 99 PRS

Structure is null. No multi-agent arm beats single-pass F1; specialists tie compute-matched sampling (p=0.73); peer debate adds nothing over a manager (p=0.12).



Extra agents buy recall at a price — up to **5×** the cost per confirmed finding.



5× more expensive per confirmed finding than single-pass review

Bounded. Recall plateaus at ≈0.83; on our own unlabeled code, LLM judges disagree (κ=0.03).

PROJECT IMPACT

- *Production platform **delivered** to the Indigenomics Institute*
- *Reconciliation commitments made **searchable and verifiable***
- *Indigenous legal precedent **explorer**, citation-anchored*

RESEARCH IMPACT

- *First **compute-matched** comparison of review architectures*
- ***Independence beats more agents** — decorrelate your verifiers*
- *Guidance for anyone deploying AI code review in production*
